OptiSwitch® Modules

The OptiSwitch® chassis based family can host two different module series, each with tens of divers modules, specifically designed to provide the precise solution for a wide variety of applications .

The OptiSwitch® has more than 90 modules available, including a range of speeds from 10 Mbps connections up to Gigabit Ethernet, and media ranging from copper, VDSL , to long reach single fiber or hybrid modules with copper and fiber . All modules independently fit the different OptiSwitch chassis and offer an unprecedented opportunity to optimize port density requirements.

Transmission technologies :

- Ethernet fiber modules
- Fast fiber & copper Ethernet modules
- Gigabit fiber & copper modules
- Gigabit Extender for 2 Km MM fiber modules
- Gigabit redundant modules for msec recovery
- CWDM with GBIC/SFP pluggable optics
- VDSL modules
- Optical Wireless modules
- Voice E1/T1 TDM over Ethernet
- Hybrid modules (copper & fiber)

EM2003 module series

The Layer 2 EM2003 module series has a communication on-board switching engine and supports wire speed non-blocking connections. Management information is collected by the switching engines, which report to the chassis' management card. The built-in management card in the chassis performs the functionality of the SNMP agent, and it communicates with SNMP compliant systems.

EM2004 module QoS series

The OptiSwitch® EM2004 module series features MRV unique Ethernet Circuit Switching technology. These modules are available in a variety of interface types and densities and provide Layer 2-3-4 switching capabilities with QoS techniques . Management information is collected by the switching engines, which report to the chassis' management card. The built-in management card in the chassis performs the functionality of

OptiSwitch® has two module series, with dozens of different modules.

the SNMP Agent, and it communicates with SNMP compliant systems. The on-board switching engines are capable of recognizing a series of frames as belonging to a specific flow ("Ethernet Circuit"), and apply policy based traffic classification and prioritization based on :

- DiffServ - ToS
- 802.1p queue mapping
- per VLAN membership
- per ingress PORT
- per MAC, IP, TCP/UDP or protocol type:
Layer 2-3-4 traffic flows (source, destination)

Each port has 4 hardware queues with two discardability options that implement QoS algorithms WRR, Hybrid , SP.

High-flexibility bandwidth management with EM2004 QoS modules allows rate limiting from 64 Kbps up to 1Gbps on each flow ("Ethernet Circuit") with 1 Kbps granularity. Rate limiting allows multiple bandwidth provisioning policies to be applied and to provide maximum flexibility for network designers to build intelligent networks.
